

Lab 02

Goal

Start the semester-long TaskTracker project, and make your first commits.

NOTE: TaskTracker starts as simple as possible — just a few lines of code. It will grow gradually over the semester as you learn more Java.

Right now it only uses things you've already seen: variables and `System.out.println`.

Configure Git (one-time setup)

- Set your name and email so your commits are attributed to you. You only need to do this once per computer.

```
git config --global user.name "Your Name"
git config --global user.email "you@example.com"
```

Create the TaskTracker project

- Open the “Git Bash” command application or a Mac Terminal (Mac Users only)
- Create a new directory named “tasktracker” and move into it

```
mkdir tasktracker
cd tasktracker
```

- Create a new local repository

```
git init
```

- Create a new file named `Main.java` with the following code:

```
void main(String[] args) {
    String task1 = "Buy milk";
    String task2 = "Walk the dog";

    System.out.println("My Tasks:");
    System.out.println("1. " + task1);
    System.out.println("2. " + task2);
}
```

- Compile the file

```
javac Main.java
```

- **Predict first:** before you run the program, write down exactly what you expect to be printed. Then run it and compare:

**My Tasks:**

1. Buy milk
2. Walk the dog

```
java Main
```

Make your first commits

- **Predict first:** before running the command below, guess what git status will report about Main.java and the .class file that compiling just created. Then check your guess:

It will state that there are uncommitted changes to "Main.java"

```
git status
```

- Add and commit your work

```
git add .
git status
git commit -m "Initial commit: basic task list"
git log --oneline
```

Submitting your solution

- Upload a PDF with screenshots of each step above, including your written predictions and whether they were correct
- Use the following Naming convention: Lab02_[Last Name].pdf

Example: Lab02_Maxwell.pdf

```
